

Extension Booms for Forklift

Forklift Extension Booms - Normally, we think of lift trucks as machinery intended for moving and picking up pallets. There are extensions existing to give the lift truck more strength and more length for heavier loads. By utilizing one of the four main forklift booms, your lift truck could be helpful for various other applications. The four main lift truck booms are the carpet boom, the coil boom, the pipe boom and the shooting boom. Each of these are utilized for attachment onto your forklift.

Coil Poles

Coil poles are connected to the carriage of the forklift. They were designed for transferring rolled coils and other rolled material like reels of wire or concrete poles. Coil poles will enable you to move whatever cylinder or rolled material too.

Carpet Poles

Carpet poles are a heavy duty accessory made from EN24T steel. They mount directly onto the forklifts' carriage. They are referred to as carpet poles but are also used to be able to transfer other kinds of rolled floor coverings along with cylinder products. They don't have the capability to lift very heavy items like for instance coil poles or concrete pipes.

Shooting Forklift Booms or Telehandlers

Shooting forklift booms are also referred to as telehandlers or telescopic booms. They are very useful on rough terrain lift trucks and raise to heights of 20-40 feet. These booms are normally utilized outside on construction job locations or within the agricultural industry.

Booms Must Not Be Used On Pipes

Extreme damage could occur to the interior of a pipe whenever utilizing whichever type of boom in order to move the pipe. It is recommended that a lifting sling be used in place of a pipe boom in this specific application. At times, steel pipes and cylinder shaped pipes must be moved with a boom when a lifting sling is unavailable. In these cases, care must be taken to make certain the pipes interior integrity.

Additional Types

Two additional booms could be used along with your forklift; the clear view boom and the low profile boom. None of these booms connects to the carriage but instead attaches to the forklifts' forks. They allow an easy transition from pallet to coiled or rolled products with the additional advantage of providing a clear line of sight for the individual operating it.

Training for Safety

Forklift operators have to complete an exercise course in order to learn how to drive the equipment in the most safe and practical method. This guidance is designed to keep the individual operating it safe and to be able to avoid any injury to individuals working nearby. Lift trucks are a heavy piece of industrial machinery and considered to be a possibly dangerous machine. Those who work with and around them have to comply with and comprehend all of the safety precautions.

Additional training must be offered to individuals who will be dealing with lift truck booms. This will make sure they comprehend how to safely work the booms. Accidents have occurred on the job from failure to carefully operate a boom. Some manufacturers provide training courses on the various types of booms and a few offer on-site education where employees could be trained directly where they will be working. This on-hand training allows the trainer a chance to address all safety concerns at that specific job location.
